# Arrays Challenge-First Repeating Element (Amazon, Oracle)

### **Problem**

Given an array **arr**[] of size **N**. The task is to find the first repeating element in an array of integers, i.e., an element that occurs more than once and whose index of first occurrence is smallest.

#### **Constraints**

 $1 \le N \le 10^6$  $0 \le Ai \le 10^6$ 

### Example

Input:

7

1534356

### Output:

2

## **Explanation:**

5 is appearing twice and its first appearance is at index 2 which is less than 3 whose first occurring index is 3.

#### Solution

<u>Base idea</u>: To check if an element is repeating, we maintain an array idx[], which stores the first occurrence (index) of a particular element a[i].

## <u>Steps</u>

1. Initialise the idx[] with -1, and minidx with INT\_MAX.

-1	-1	-1	-1	-1	-1	-1	-1

2. Keep updating idx[], while traversing the given array.

Given Array:	1	5	3	4	3	5	6	
							7	

## <u>Iterations</u>

• At i = 0:								
Given Array:	1	5	3	4	3	5	6	
	Ì							
Idx[]:	-1	0	-1	-1	-1	-1	-1	-1
• At i = 1:								
Given Array:	1	5	3	4	3	5	6	
		1						
Idx[]:	-1	0	-1	-1	1	-1	-1	-1
• At i = 2:		8		le.		i di		
Given Array:	1	5	3	4	3	5	6	
			1					
ldx[]:	-1	0	-1	2	-1	1	-1	-1

At i = 3: 5 6 Given Array: 1 3 4 3 5 Î Idx[]: -1 0 -1 2 3 1 -1 -1 At i = 4: 6 5 Given Array: 5 3 3 1 4 Î -1 2 3 Idx[]: -1 0 1 -1 -1 At i = 5: 5 Given Array: 1 3 4 3 5 6 Î Idx[]: -1 -1 1 -1 0 -1 2 3

At i = 6: Given Array: 1 5 3 4 3 5 6 Î Idx[]: -1 6 2 3 1 -1 0 -1

# Arrays Challenge - Smallest Positive Missing Number (Amazon, Samsung, Snapdeal, Accolite)

## **Problem**

Find the smallest positive missing number in the given array.

Example: [0, -10, 1, 3, -20], Ans = 2

#### Intuition

If in O(1), we can tell if an element is present in an array, then our task will be simpler.

For that, we will maintain a Check[] array, that will if an element x is present in the array or not.

It will be of boolean type as we only need to check the presence or absence of the number.

## **Steps to Solve:**

- 1. Build the Check[] array initialized with False at all indices.
- 2. By iterating over the array and marking non-negative a[i] as true i.e.

- 3. Iterate in the Check[] from i=1, BREAK the loop when you find check[i] = False and store that i in the ans variable.
- 4. Output the ans.

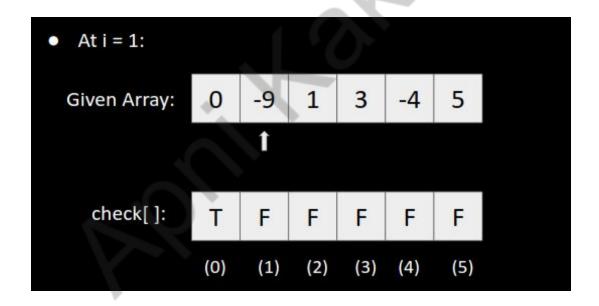

## **Example:**

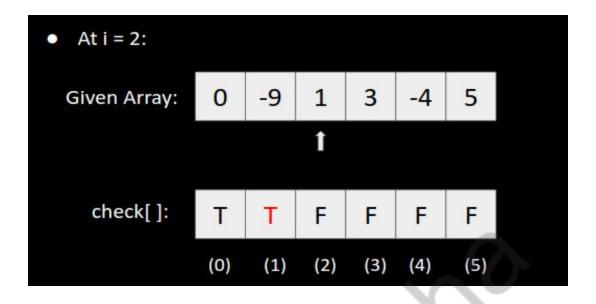

Given Array: [0, -9, 1, 3, -4, 5]

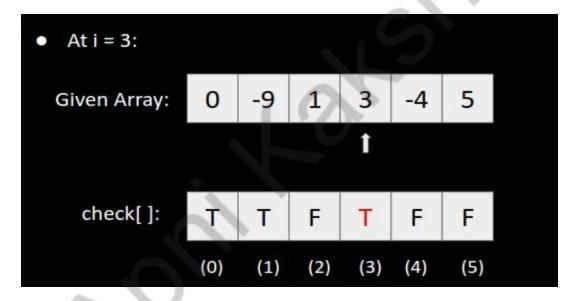

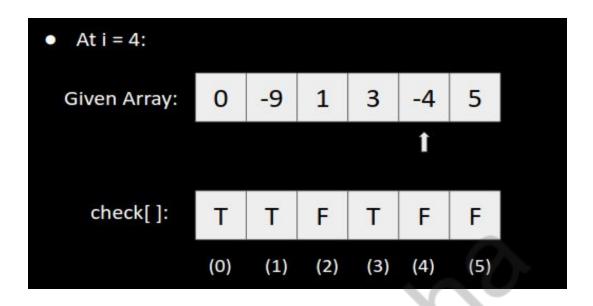

<u>Iterations</u>

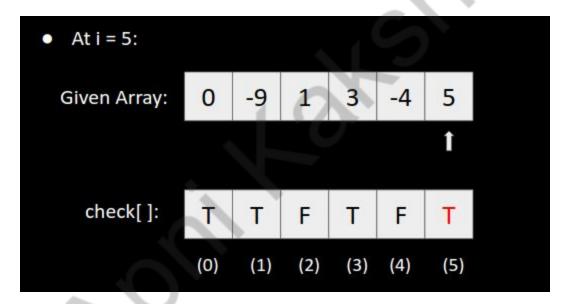

• At i = 0:							
Given Array:	0	-9	1	3	-4	5	
	1						
check[]:	T	F	F	F	F	F	
	(0)	(1)	(2)	(3)	(4)	(5)	

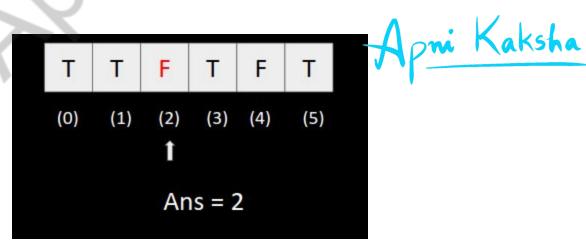

## Arrays Challenge-Subarray with given sum (Google, Amazon, Facebook, Visa)

#### Problem

Given an unsorted array **A** of size **N** of non-negative integers, find a continuous subarray which adds to a given number **S**.

#### **Constraints**

$$1 \le N \le 10^5$$
  
 $0 \le Ai \le 10^{10}$ 

## **Example**

Input:

Output: 24

Explanation: The sum of elements from 2nd position to 4th position is 12.

#### Solution

**Brute Force Solution** 

• Find sum of all possible subarrays. If any of the sum equates to **S**, output the starting and ending index of the subarray.

Time Complexity : **O(n²)** 

## **Optimized Approach**

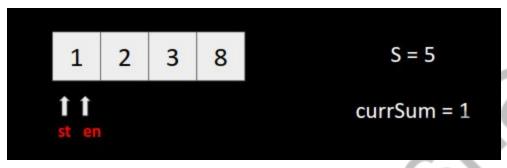

Steps:

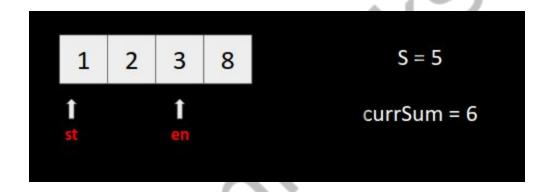

- 1. Keep the pointers st and en, and a variable currSum that stores the sum from st to en.
- 2. initialize st = 0, en = 0
- 3. Increment en till currSum + a[en + 1] > S
- 4. When 3rd condition occurs, start increasing st until currSum <= S.

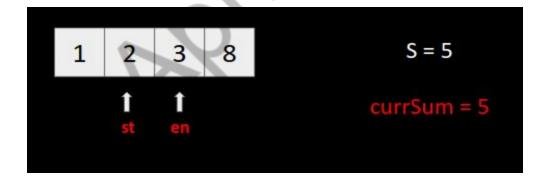

5. Whenever the condition (currSum = S) is satisfied, store st and en and BREAK from the loop.

Time Complexity: O(n)

## <u>Iterations</u>

Apni Kaksha

#### Code:

```
void SubarrayWithGivenSum()
    int n,s;
    cin >> n >> s;
   int a[n];
    for(int i=0; i<n; i++)</pre>
        cin >> a[i];
   int i=0, j=0; int st=0-1, en=-1; int sum = 0;
   while(j < n && sum + a[j] <= s){
        sum += a[j];
        j++;
   if(sum == s){
        cout <<\overline{i}+1 <<" "<< j << endl;
   }
while(j<n){</pre>
        sum += a[j];
        while(sum > s){
            sum -= a[i];
            i++;
        if(sum == s){
            st = i+1;
            en = j+1;
        j++;
   cout << st <<" "<< en << endl;
```
